

BridgeThings

*A novel and highly scalable wireless monitoring
& control solution*

The Challenge

The need for monitoring resource consumption is growing – Climate change policies and global competitiveness are driving this change – PAT scheme, GreenPro / Industry norms etc.

Resource consumption
monitoring

“Things” that needs to be monitored are growing – understanding consumption in detail has become necessary to improve performance & drive efficiency.

Energy

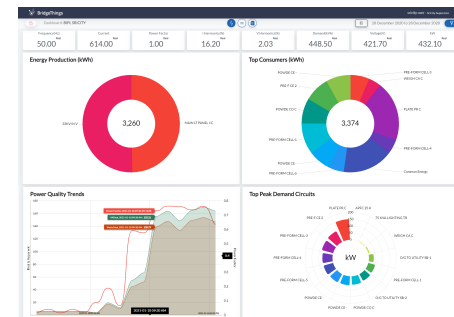

Water

Lighting

Solar

Monitoring different
assets

Gas

Fuel

Air Conditioning

Biogas

A unified approach

- Wireless network with BridgeThings Long range IoT gateways – covering entire facility.
- Wireless sensors will be connected to energy/water/gas/fuel meters or anything that needs to be monitored, like motors, pressure, temperature etc.
- Sensors upload consumption data to cloud via the gateway – 24x7
- Cloud based data analytics platform for understanding consumption patterns and improve efficiency.

Wireless Utility monitoring & efficiency

1 MW Biogas/ Solar Unit

- Continuous load data
- Energy consumption patterns
- Power quality information

BridgeThings Long range wireless

Grid Connection

- Segregated Unit wise consumption
- Load contribution information
- Unit wise energy cost information

BridgeThings Long range wireless

Cloud Server

- Fuel, gas consumption can be monitored and correlated with production information
- Process data like operating temperature, pressure can also be monitored by the same system
- Loads like HVAC & Lighting can be monitored and optimized.

Other utilities & process information

Fuel

Gas

Process data

HVAC

Lighting

- Complete water consumption data – supply & demand.
- Effective planning of water supply with detailed understanding of consumption patterns

Energy Consumption

Unit - V Energy
Meter

Water Consumption

Water for steam

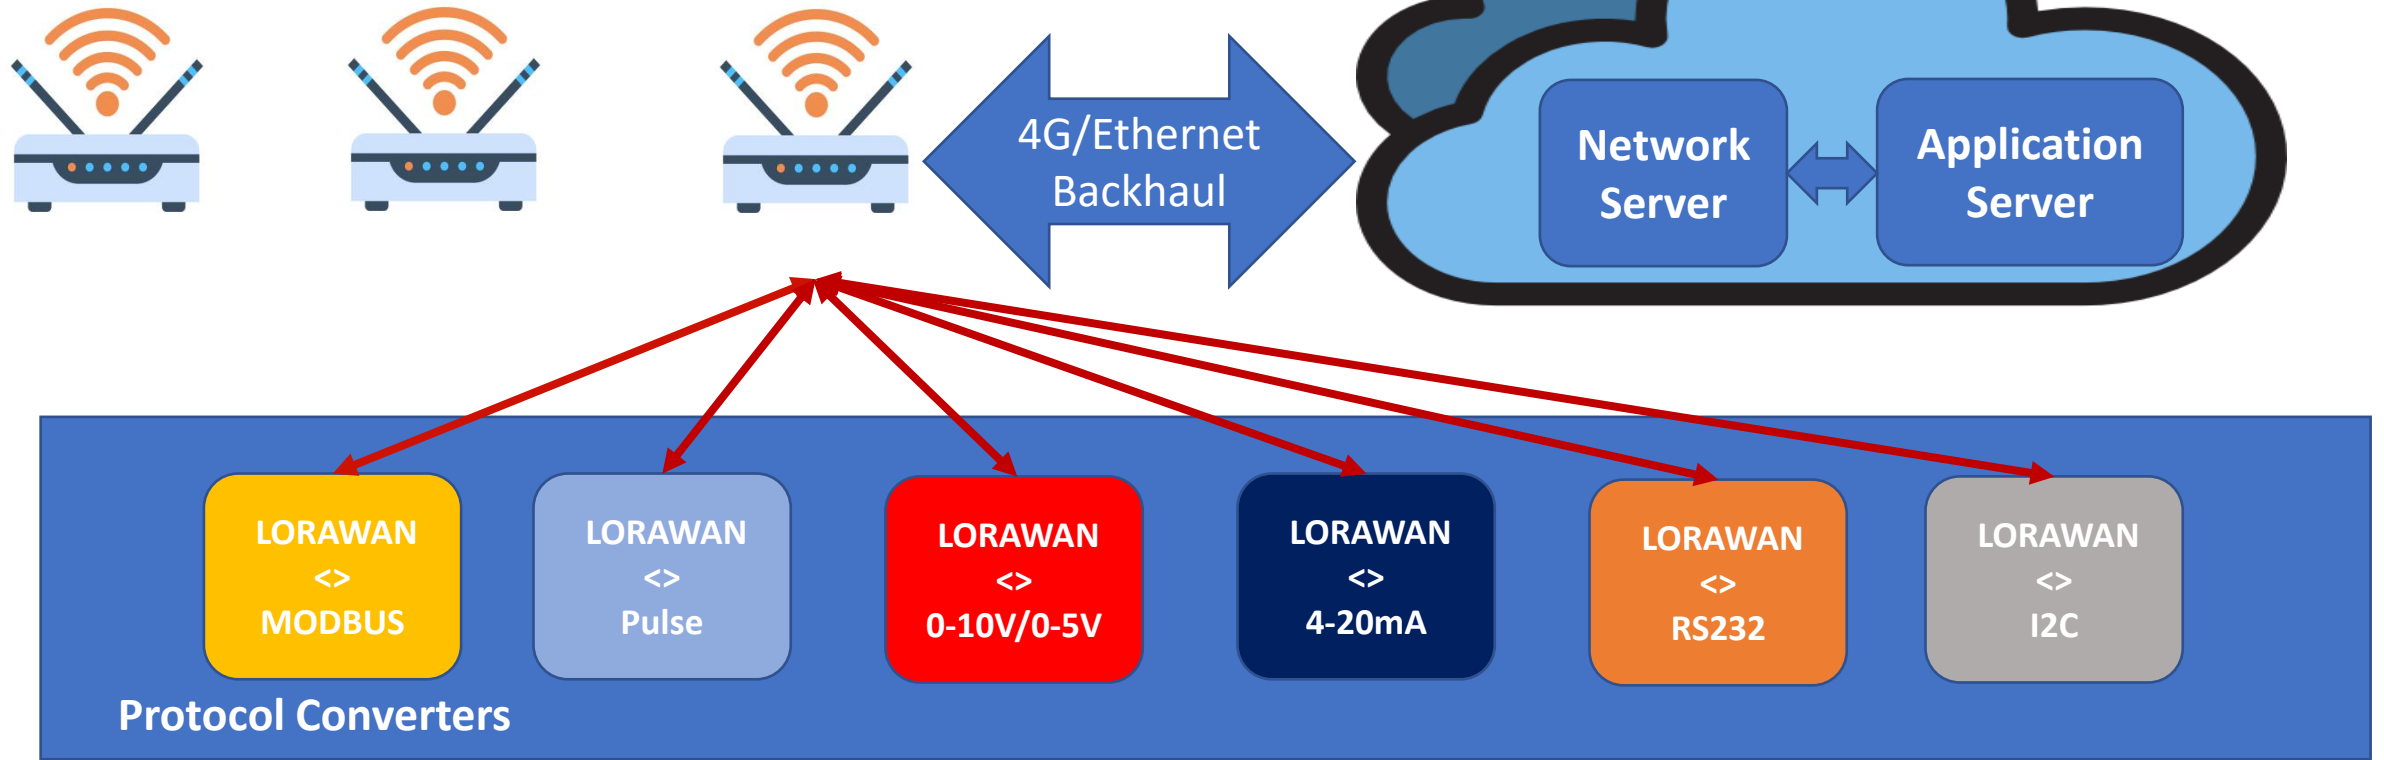

Process water

Borewell water

LoRaWAN Gateway(s) Each serving a range of 2KM radius

Energy Meter

Water Meter

PLC

4-20mA/RS485 with LED Display

4-20mA Sensors

RS232 Sensors

I2C Pressure Sensors

Installations

Use Case – Specific Energy monitoring & management.

- Energy, water supply & consuming assets are widely distributed in the facility.
- Monitoring them on continuous basis will help us understand consumption patterns.
- For example – Understanding what stage the facility is consuming more resources – **what's the peak specific energy** ? – energy/tonne

Use Case – Water Monitoring

- Water flow meter are usually widely distributed across the plant. A wired system is difficult to execute
- Wireless system will help in easy integration and any future deployments – drop in an end node and data will be uploaded
- Helps you increase the number of points that are monitored, helping you to understand your consumption better.

Use case – Emergency Light monitoring

- Emergency lights are critical for safety - They need to be lit 24x7.
- Monitoring them daily to replace failed ones is an important task.
- Battery powered, lux monitoring sensors can easily monitor emergency lamps and relay the information to a central dashboard.
- Quick replacement of failed/flickering lights – can help a lot during emergency.

Use Case - Monitoring motors

- Wirelessly monitor condition of motors to predict failures and save critical production time.
- Easy to integrate assets that are widely distributed onto to a single cloud platform.
- Understand assets that are relatively highly stressed in the entire production line.

Use Case – AC Energy Savers

- BridgeThings SPAC energy savers monitors temperature & humidity in a space and control air-conditioners to operate in a comfortable zone.
- Split ACs across the plant/facility can be controlled from a central dashboard like setting a fixed setpoint
- Understanding the cooling pattern of each AC – will help us know if it requires immediate maintenance – filter blockages, lower rate of cooling etc.
- Can control any air-conditioner, irrespective of tonnage and make.
- As our devices are not connected to the AC's directly, there won't be an issue with the warranty

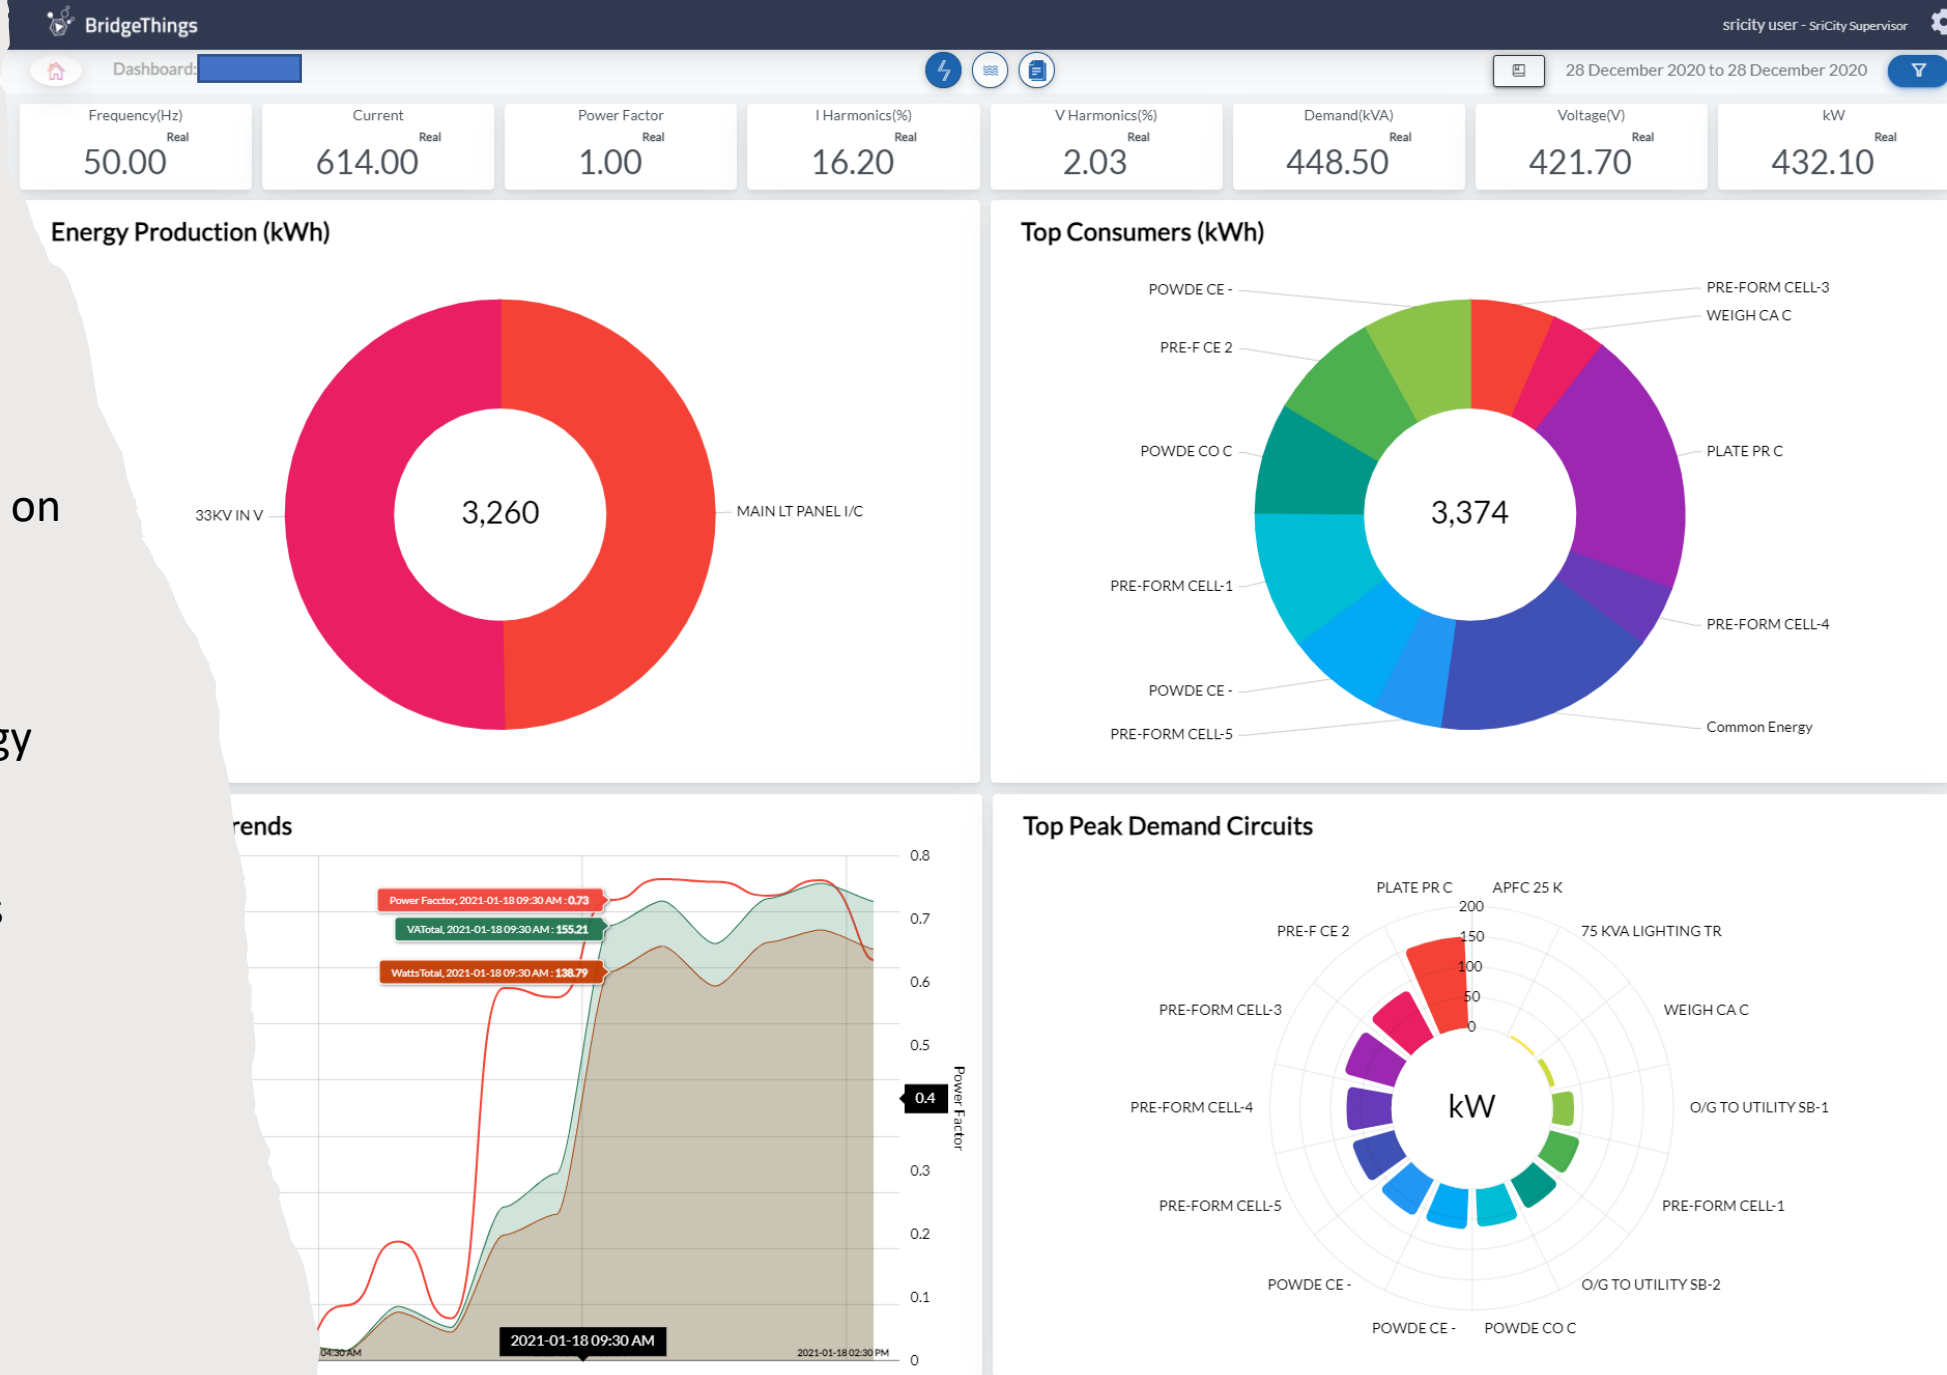

Cloud – based dashboard.

Complete energy consumption data available on the cloud.

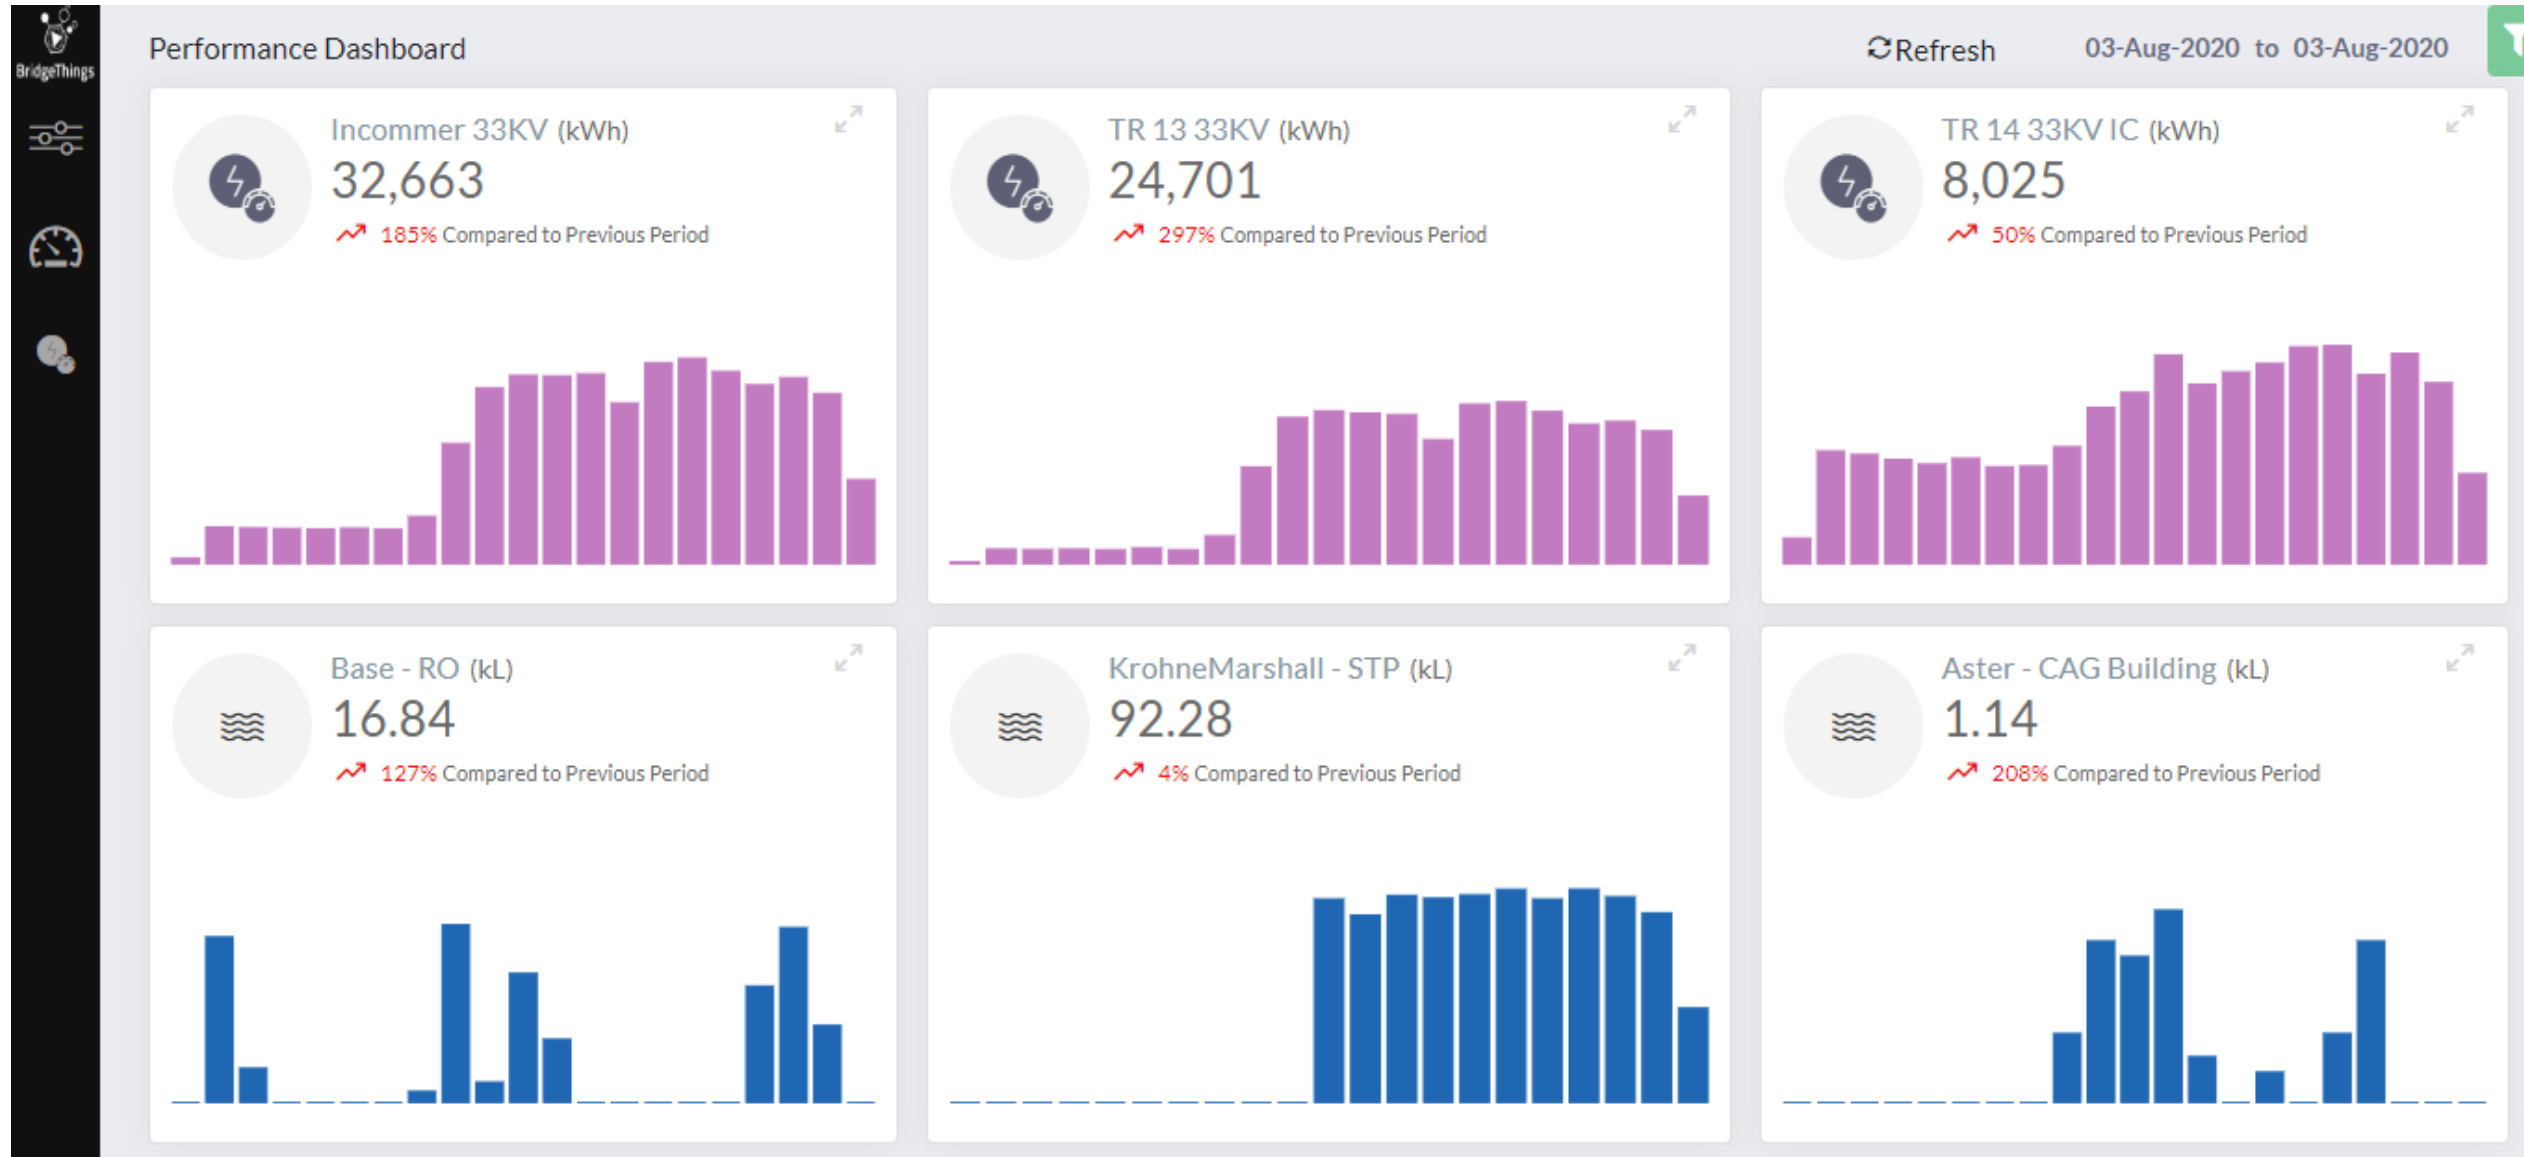

Alerts can be configured based on avg. specific energy usage.

Quantify the improvements done at each stage of the production line.

Take steps towards sustainable by improving resource consumption in a phased manner.

Customized dashboard - Monitoring multiple utilities

Time based/Shift wise energy monitoring

Incommer 33KV Energy Report
